THIS IS NOT MANUFACTURING
THIS IS MANUFACTURING
AND TOMORROW, THIS
"Smart manufacturing" will generate $371 billion in net global value over the next 4 years: by 1) creating value from data and 2) streamlining design processes, factory operations, and supply chain risks. (IDC)
Smart Manufacturing & Smart Design

Engineering processes like **design**, **testing**, and **optimization** can only go so fast in the physical world.

- Autodesk’s Project Dreamcatcher: “Algorithmically generated” design software allows designers to generate designs based on a list of material and performance requirements.

- Airbus and Boeing use such “generative design” modeling and simulation tools.
The Internet of Things (IoT)

- By 2020, somewhere from 26 to 50 billion “things” connected to the Internet.
- Cost of sensor technologies have declined 100X last 10 years.
- In the past three years, the number of sensors shipped has increased more than five times from 4.2 billion in 2012 to 23.6 billion in 2014.
Mfg. Poised to See Biggest Gains from IoT

Potential economic impact of IoT in 2025, including consumer surplus, is $3.9 trillion to $11.1 trillion

Source: McKinsey Global Institute, The Internet of Things: Mapping the Value Beyond the Hype
The Internet of Things & Manufacturing

- IoT applications in mfg. and factory settings expected to generate $1.2 to $3.7 trillion of economic value annually by 2025.

- *IoT will revolutionize manufacturing processes.*

- *IoT will revolutionize manufactured products and product systems.*
IoT and Manufacturing Processes

IoT will generate 4 primary forms of value in terms of manufacturing processes:

1. Supply Chain Management;
2. Operating Efficiency;
3. Predictive Maintenance;
4. Inventory Optimization.
IoT and Supply Chain Management

- IoT can help manufacturers better manage their supply chains.

- BMW: Knows the real-time status of all machines producing all parts/components from all suppliers going into vehicles.

- Toyota: Reduces recalls by knowing exactly what machine produced which components of which vehicles.

- HP: Integrates network analysis and data visualization into its supply chain management and monitoring; has reduced the time for supply chain management projects by up to 50%.
IoT and Manufacturing Operating Efficiency

- IoT provides manufacturers a comprehensive view of what’s occurring at every point in the production process and helps make real-time adjustments.

- Will increase manufacturing productivity by 10-25%.

- Producing up to $1.8 trillion in global economic value by 2025.
IoT and Manufacturing Operating Efficiency

Explosion of low-cost sensor technologies has made every manufacturing process and component a potential data source.

- **Ford**: Placed sensors on virtually every piece of production equipment at its River Rouge facility.

- **GM**: Uses sensors to monitor humidity conditions during vehicle painting; if unfavorable, the work piece is moved elsewhere in plant or ventilation systems adjusted.

- **Raytheon**: Keeps track of how many times a screw has been turned in its factories.

- **Merck**: Improves vaccines by conducting up to 15 billion calculations to determine what environmental and process factors influence quality of final product.
**IoT and Predictive Maintenance**

- **Monitor the status of production equipment in real-time.**
  - Intel: Uses predictive modeling to anticipate failures, prioritize inspections, and cut monitoring costs, save $3M.
  - Ford: Downstream machines can detect if work pieces they receive are off in a particular minute dimension, indicating possible problems in upstream machines.
  - GE “Brilliant Factories” initiative doubled production of defect-free dishwashers and washing machines.
IoT and Predictive Maintenance

- IoT expected to reduce factory equipment maintenance costs by up to 40%.

- Expected to reduce equipment downtime by up to 50% and is expected to reduce capital equipment investment costs 5%.

- Generating economic value of $630B annually by 2025.
IoT and Inventory Optimization

- IoT helps manufacturers better manage inventory.

- Wurth USA: Developed an “iBins” system that uses intelligent camera technology to monitor the fill level of a supply box and wirelessly transmit the data to an inventory management system that automatically reorders supplies.

- IoT can drive inventory optimization measures that can save 20 to 50% of factory inventory carrying costs.
Other IoT Apps. In Mfg. Processes

- Safety: IoT applied to devices and workers (e.g., badges) can alert or even halt equipment if in too close of proximity.

- Leveraging data on factory equipment for usage-based design (improve equipment performance or reduce parts needed.)
IoT & Smart Manufactured Products

All “smart products” share three key components:

1. *Physical components*: E.g., Mechanical and electrical parts.

2. *Smart components*: E.g., sensors, microprocessors, data storage, controls, software, an embedded operating system, and a digital user interface.

3. *Connectivity components*: E.g., Wireless connectivity, ports, antennas, etc.
Maturity Scale for Smart Manufactured Products

The capabilities of smart, connected products can be grouped into four areas: monitoring, control, optimization, and autonomy. Each builds on the preceding one: to have control capability, for example, a product must have monitoring capability.

1. **Monitoring**
   - Sensors and external data sources enable the comprehensive monitoring of:
     - the product’s condition
     - the external environment
     - the product’s operation and usage
   - Monitoring also enables alerts and notifications of changes

2. **Control**
   - Software embedded in the product or in the product cloud enables:
     - Control of product functions
     - Personalization of the user experience

3. **Optimization**
   - Monitoring and control capabilities enable algorithms that optimize product operation and use in order to:
     - Enhance product performance
     - Allow predictive diagnostics, service, and repair

4. **Autonomy**
   - Combining monitoring, control, and optimization allows:
     - Autonomous product operation
     - Self-coordination of operation with other products and systems
     - Autonomous product enhancement and personalization
     - Self-diagnosis and service

Designing Smart Manufactured Products

*Design and Product Development:*

- The mindset of those who design products will have to change from designing a product to designing products that operate within systems.

- Product development will shift from being largely mechanical engineering to true interdisciplinary systems engineering.
Design Implications for Smart Mfg. Products

- **Low-Cost Variability:** The software in smart, connected products can make variability far cheaper.

  John Deere: Previously manufactured multiple versions of engines with differing horsepower levels, now it can alter the horsepower of standard engines with software alone.

- **Evergreen Design:** Continually upgrading of existing products.

  ABB Robotics: Industrial machines can be remotely monitored and adjusted by end users during operation.

  Tesla: Has put an “autopilot” system in its cars with the intention of enhancing the system’s capabilities over time through remote software updates.
Business Model Implications

- **Product Servification – Selling Products as a Service (PAAS)**
  
  Rolls Royce: Sell “power by the hour”
  GE Aircraft Engines: Sell “guaranteed thrust”
  Johnson Controls: Sell “chilled air at 72°”

- **Product design/data capture essential for PAAS models**

  Xerox’s Managed Print Services:

  Turns a fixed cost into a variable cost for customers; has helped clients like P&G reduce paper use by 40% and cut costs 25%.

  Added sensors on the photoreceptor drum, feeder output tray, and toner cartridges to enable accurate accounting.
Moving From Smart Products to Smart Systems

Today’s Presentation

1. U.S. Advanced Manufacturing Policy
2. Digital Manufacturing & Internet of Things
3. Internet of Things Policy Issues
Why Countries Need National Strategies for the Internet of Things

By Joshua New & Daniel Castro  |  December 16, 2015

The Internet of Things offers many opportunities to grow the economy and improve quality of life. Just as the public sector was instrumental in enabling the development and deployment of the Internet, it must play a similar role to ensure the success of the Internet of Things. Therefore, national governments should create comprehensive national strategies for the Internet of Things to ensure that the technology develops cohesively and rapidly, that consumers and businesses do not face barriers to adoption, and that both the private and public sector take full advantage of the coming wave of smart devices.

Traditionally, most Internet users have been people: individuals sending email, reading the news, shopping online, and the like. But in the near future, most users will be machines: a vast array of ordinary devices that are equipped with sensors and networking capabilities so they can collect and share data with people and other devices. In fact, we are already well on our way toward building the Internet of Things (IoT). As the cost of deploying smart devices declines, homes, factories, farms, office buildings, and even cities are generating vast quantities of data that can be collected, analyzed, and acted upon. Data from these connected devices is creating tremendous opportunities to generate economic and social benefits, ranging from sensor-equipped bridges that can alert authorities if there is a risk of structural failure to waterways that can warn environmental regulators about spikes of fatally toxic algae.1

Smart public policies that proactively support innovation—or carefully avoid doing harm by restraining from the impulse to regulate or if needed, regulating with a light touch—have been integral to the success of major...
Why Countries Need a National IoT Strategy

1. IoT Suffers from Market Failures and Externality Effects

   E.g., Accrual of societal benefits depend on the broad adoption of IoT-enabled solutions (thermostats/health).
   E.g., Competitiveness Externalities

2. IoT Suffers from “Chicken-and-Egg” Challenges

   E.g., The success of many IoT apps depends on the success of complementary technologies/systems (e.g., energy/transit).

3. Interoperability and Standards-Setting Issues

   E.g. Governments have an important coordinating role to play in developing large-scale deployments of sensor networks and smart infrastructure that spans multiple jurisdictions.
Why Countries Need a National IoT Strategy

4. Workforce/Human Capital Gaps

“By 2018, U.S. will face a shortage of up to 190,000 workers well-educated in data science and 1.5 million managers and analysts able to use data to make better decisions.”

Two-thirds of businesses say they lack “the human capital needed to effectively use new data.”

5. Ensuring adequate radio spectrum and coherent regulatory approach.

Table 1: Ongoing and recently launched government funding for the Internet of Things for select countries.
What Should National IoT Policies Address?

Funding

- Funding local government efforts to implement connected technologies and services;
- Funding large-scale national pilot projects for smart cities that focus on integrating multiple smart city applications with scalable and replicable solutions;\(^72\)
- Establishing national challenges with prizes to spur the development of IoT applications with high social or economic impact;
- Subsidizing key connected devices for low-income populations;\(^73\)
- Funding R&D for key underlying technological challenges relevant to the Internet of Things, such as improving cyber security and reducing power consumption; and
- Establishing government-backed venture capital funding for promising connected technologies that could benefit public sector operations.

Source: Dan Castro and Josh New, Center for Data Innovation, *Why Countries Need National Strategies for the Internet of Things*
What Should National IoT Policies Address?

Convening and Planning

- Encouraging robust public-private partnerships for ambitious civic technology projects;
- Facilitating local government smart city deployments, such as by providing best practices and financing guides and freely accessible software tools;
- Coordinating public sector deployments of sensor networks, particularly for applications spanning multiple jurisdictions; and
- Encouraging the development of industry-led voluntary standards and best practices around issues like privacy and security.

Source: Dan Castro and Josh New, Center for Data Innovation, *Why Countries Need National Strategies for the Internet of Things*
What Should National IoT Policies Address?

Agency Action

- Requiring relevant government agencies to develop and follow Internet of Things action plans focused on improving agency mission delivery with connected technologies;
- Revising procurement and grant policies to encourage deployment of connected devices;
- Making “smart” the default for government operations, such as by requiring the use of connected technologies for customs inspections, integrating smart technologies into government-subsidized housing and agency buildings; and embedding sensor networks into infrastructure as part of modernization efforts; and
- Supporting data science skills in high school and higher education.

Source: Dan Castro and Josh New, Center for Data Innovation, *Why Countries Need National Strategies for the Internet of Things*
What Should National IoT Policies Address?

Regulatory Action

- Allocating additional licensed and unlicensed spectrum for connected devices;
- Ensuring that any consumer protection rules are narrow and targeted;\(^75\)
- Minimizing the regulatory cost of data collection;\(^76\)
- Fast-tracking regulatory review and approval for smart devices in regulated industries, such as connected medical devices;\(^77\)
- Enacting regulations to increase the potential for data-driven innovation from connected devices, such as by giving public utility consumers access to their smart meter data; and
- Revising accessibility requirements for people with disabilities based on the opportunities created by connected technologies, such as dynamically adjusting the amount of accessible parking spaces based on sensor data indicating demand.

Source: Dan Castro and Josh New, Center for Data Innovation, *Why Countries Need National Strategies for the Internet of Things*
What Should National IoT Policies Address?

Trade Policy

- Ensuring that companies can freely exchange data across local and national borders;
- Promoting access to the best and most cost effective connected devices and services, such as by eliminating policies that restrict the ability of international device manufacturers to enter domestic markets; and
- Supporting voluntary, industry-led standards and fighting against nation-specific standards.
