

The image shows two industrial robotic arms in a factory setting. The arm on the right is actively welding a metal piece, creating a bright blue light and a shower of orange sparks. The background is a complex industrial structure with metal beams and lights, slightly out of focus. A semi-transparent dark grey banner is overlaid at the bottom of the image, containing text and the Autodesk logo.

The Future of Making

World's #1 Open Science Supercomputer

Flagship accelerated computing system | 200-cabinet Cray XK7 supercomputer |
18,688 nodes (AMD 16-core Opteron + NVIDIA Tesla K20 GPU) |
CPUs/GPUs working together – GPU accelerates | 20+ Petaflops

High Performance Computing (HPC) allows scientists and engineers to solve complex, compute-intensive problems.

HPC applications often require high network performance, fast storage, large amounts of memory, very high compute capabilities, or all of these.

HPC enables you to increase the speed of research and reduce time-to-results by **running HPC in the cloud** and scaling to larger numbers of parallel tasks than would be practical in most on-premises environments.

AMAZON'S HPC CLOUD: SUPERCOMPUTING FOR THE 99 PERCENT

By [Jon Brodkin](#), Ars Technica

The Amazon Elastic Compute Cloud is becoming increasingly popular for high-performance computing. It's now capable of running many of the applications that previously required building out a large HPC cluster or renting time from a supercomputing center.
